대담 순서

시각	질문
00:00	진행자 소개(필라델피아, 해버퍼드·스탠퍼드·프랑크푸르트, sovereign AI 운동)
02:00	철학·법학·사회이론 배경이 지금 일에 준 것 — 창의성, 난독증
04:03	팔란티어를 "artist colony"라 부르는 뜻
09:18	전쟁부(Department of War)·Maven, 낯선 인재를 기업에 들이는 "transfer mechanism"
11:39	상업 고객에게 팔란티어가 푸는 문제 — Foundry, sovereign architecture, Ontology
14:34	가치를 못 내는 토큰 비용과 IP 유출, 보안
18:04	AI 경쟁은 에너지·반도체·데이터센터의 문제인가 — 부의 집중이라는 정치 문제, 부유세와 감시국가

시각	질문
21:29	공익법인(public benefit corporation) 움직임
28:20	미중 AI 경쟁 — 일본·중국사 비유, 유럽의 선택지

주요 대목

- **08:36** 비트겐슈타인의 규칙 따르기("to believe you're following a rule is not to follow a rule")를 조직 운영에 빗댄다.
- **12:23** sovereign architecture를 고객이 만들고 소유하는 모델에 조직의 "tribal knowledge"를 넣는 구조로 설명한다.
- **14:16** 비용과 가치를 통제하려면 애플리케이션 플랫폼이 있어야 하고, 그 규모로 있는 것은 자사 Ontology뿐이라고 말한다.
- **26:01** 부유세는 개인 자산을 실시간으로 들여다볼 제품을 요구하므로 감시국가를 넓힌다. "things people think I power but I'm actually anti-power"라고 말한다.
- **32:25** 칩·컴퓨트·소프트웨어·통합층·애플리케이션층·sovereign 판본으로 이어지는 "total stack"은 미국 아니면 중국에만 있다고 말한다.

전사

[00:00] Good morning, everyone, and sorry not to be in Rome. Palantir sits today at the frontier of artificial intelligence, and at its helm is its co-founder and chief executive, Alex Karp. Alex, thank you for joining us today, and thank you for the relationship that you and Citi have developed here right now. We're very pleased, and we look forward to great things in the future. Alex was raised in Philadelphia, as we were just talking about here, by an artist and a pediatrician who marched for civil rights. He learned how to question power and orthodoxy early on, and then he went ahead and got incredibly well educated. He studied philosophy at Haverford, earned a law degree at Stanford, and completed a doctorate in social theory in Frankfurt, and together with Peter Thiel in 2003, Alex co-founded Palantir. He's an avid cross-country skier, and for those of you that are not here today, you can see how fit he is, and also an avid distance shooter.

[01:00] Alex is a fellow of the Technology Republic, and launched something that we'll talk about a little bit later on, and that is what is broadly known today as the sovereign AI movement. He's one of the rare leaders in tech who says exactly what he thinks. Alex, thank you for being here today. I'm delighted to be here. I'm delighted for a relationship. I'd like to see you. I'm happy seeing you. I didn't realize how good you were at this. That's a phenomenal introduction. You even have a more professional voice on TV, and it's not true, by the way, that I say exactly what I think. It's just what I'm saying is mostly I do edit. It's just what comes out is still so far out the norm in some cases that people—but there's still an edit function.

[01:42] And I edit by thinking, would my mom just go under the desk and be ashamed if I said it, or would she just be slightly embarrassed?

[01:50] But that's a good governor, and as I've said to other people about you, listen carefully to what he says because it's actually been very well thought through, at least from my standpoint. But let's get into this because your background relative to where you are today is so different. After studying philosophy, law, and social theory, as we just talked about, you managed money for European families and then built one of the most consequential technology companies in the modern era. Alex, what about that kind of background gave you the experience to be able to do what you're doing?

[02:26] What did those early experiences help you without having a pure technology background?

[02:31] You know, there are all these questions that there's like formal answers for, and I wish I knew the real answer. I really do. My best version of an answer is most people who are, broadly speaking, in business endeavors, broadly defined, here I'm including anything where something has to deliver. Foundation—I mean, many of these things don't work anymore. But as a matter of theory, foundations, international organizations, universities, businesses, I am a primarily creative human being. And creative is different than pure execution, and that creativity I inherited from both sides.

[03:15] We were outside the norm on every variable. And then I am—the one thing I've hid most of my life until recently is I am, by any normal standard, severely dyslexic. And that disability lends itself on the positive side to being more able to work quicker, more creatively, more honest with oneself, and able to process things that are probably outside of distribution, to use a slightly technical term. And the value of things is pretty correlated to are they outside of distribution, and can you get them into distribution?

[03:57] But we're going to double click on that in a minute, because we're also going to talk about the artist colony. For those of you that don't know, Palantir went public with a direct listing. I think the market cap at the time was like $15, $16 billion. Today it has a market cap—With $7, $7.12 a share or something?

[04:17] I remember the price well, because it was also, in keeping with Alex, unusual, a direct listing, not an IPO. But Alex, you describe Palantir as an artist colony. What do you actually mean by that, and what's the underlying ideology that this brings to you?

[04:33] Well, I mean, it's like always, you know, our—I think anybody—we have a lot of people we've embarrassed who didn't invest or otherwise, but I think all of them would say Palantir—over 20 years has had the highest bar for talent, and that talent has gone on to do among the more formative things in defense tech but also, you know, in the AI movement. We look for people who are unusually jagged, and we—I try to work to slot people and increase their intelligence where it's unusual.

[05:15] And that ends up with a very difficult-to-manage environment. We have a flat hierarchy to manage that. But if you can converge an actual important thing inside the company, which usually has a societal hook, to someone's n of one or n of a very small number of talent, you can build things that no one else can build, which I would say— institutional integration, managing of AI context, battlefield context. And then, interestingly, you know, like I think some of these movements, the defense tech and sovereign as an example, we were the primary leaders in creating a movement, which is now not only our movement.

[06:15] It's also the ability to think into your background. In other words, the ability to think and to be creative from that standpoint. And to accept creativity of others, which means that they can do and express things you can't do, which I think, as a generalization, our organizations do not exactly excel at. So, as a generalization, the person who sticks out who may be better at something gets fired, especially if they're telling the truth at all. And so, here, I don't mean commercial institutions. I mean, look what's happened to our educational institutions, our basic functioning. Like, why does Europe struggle to have a taxi? Or why do we struggle to produce new and creative things?

[07:07] And I think part of the problem is just it's very difficult for humans to accept that there's a human that they're working with that is so much better at something that they can barely understand it. And harnessing that, though, is something, by the way, that I think we uniquely

do well in the West when we do it well. And then, I think it's very important for us in America and then in Europe because this is actually our sole advantage. As a matter of theory, we've been doing this for a thousand years, but it is very, very hard to do because there's an humiliation aspect to it, and none of us really.

[07:49] But if you are working in a context where you believe that that artistry is the only thing that can create a certain kind of beauty, and you see it work over and over and over again, sometimes it doesn't work, you get more comfortable with that. And actually, interestingly, over time, you understand the psychological pain that's inflicted inherently in being in that environment is what you associate with something that's working. And actually, I think one of the primary things we train people in is, you know, people always have this thing we grew up, does it feel good or feel bad?

[08:25] But sometimes, like, all medicine is kind of poison, and getting people to accept and embrace for real, not on paper. Like, we all say these words. So that's the other thing. It's like, everyone says it. It's like, you know, Wittgenstein, a very important statement from Wittgenstein was to believe you're following a rule is not to follow a rule. And in German, it's particularly tight. But it's like, we all say, like, all this stuff, we're all saying it. Everybody will say these words. Now go do it. It's really, really hard. You have a 12-year-old looking person who's like, but Dr. Karp, I think basically everything you've done is wrong, or everything you think here, or they have a way of framing thing.

[09:07] Okay, how do you interact with them? By the way, they're not always right. So you have to manage that. And how do you insert yourself into their aptitude without destroying it while raising it?

[09:18] But you've actually inserted. So now let's keep going further on that, because that's a great aperture into actually the business. You've inserted yourself into places that are incredibly consequential. The U.S. Department of War. Maven. Can you give us a description of what it does? Well, I mean, honestly, that's the neutral thing. But you're sitting in Europe, like almost all relevant anti-terror efforts. Europe would be different without these anti-terror efforts. What's happening in France would have already happened. And Ukraine, I'm under serious security constraints because of the enormous role we play. Certain parts of Israel.

[10:03] And this is actually, I think, a particularly interesting point you're making. What we are tacitly saying is, okay, I see how you could manage an honest colony and it could create value. But it's another big leap, and this is the business acumen, to getting that into an enterprise that might not be able to appreciate or value that and getting them to adopt on their terms while it's not their terms. And an enterprise that, frankly, has done it a certain way for decades with an inherent group of people where you're bringing in something very, very new. Well, we're bringing in people that don't seem the same. The philosophical thing that's interesting is how do you do this and then have a transfer mechanism? Because at the first instance, they're not at all correlated. Now, it's not true, because without the transfer mechanism, we don't know what to build.

[10:54] So the transfer mechanism also affects the product, and so that's where we ended up with FDEs and me on the front line dealing with the clients and all sorts of other things. But at a first instance, this is exactly, I met the patriarch of the Crown family, and he basically asked the same question. He's a titan of industry. He's like, okay, but how did you get the first olive out of the jar?

[11:18] Because having the olive, that's one thing. Having people adopt it, and then the trick is not just to get them to take the olive, but to change their taste so they appreciate the taste of the

right olive. And that is complete artistry, and I don't know exactly how we do it, but I know that we know how to do it. But you've done it in a variety of places, because now let's move away from defense and talk about commercial enterprises. Everyone in the audience understands Accenture and SAP and McKinsey and Microsoft and what they do for a large enterprise. What is the problem that Palantir is solving for a large organization?

[12:00] I mean, at this point, the crazy thing is it depends on the enterprise. We have a basic offering, which is Foundry, which will allow you to integrate all your data sets. In many cases, a crucial step that does not happen. That's what we were doing in 2017, maximally, all the way. Then we began doing more complicated things. We'd be like, how do you run your ideas on the enterprise? You can think of passive searches, pre-AI. Now, at the final, what we're doing with a lot of people is the sovereign architecture, which is how do you power models you create, you own, that you may want to selectively share with others?

[12:36] So you could white label them or not. How do you own the whole stack and impregnate your tribal knowledge into your enterprise in a one-to-one way so you're not losing it?

[12:45] So CEO can actually change their own enterprise and augment what they know with models in our products so the models actually work. How do you do that at scale?

[12:55] But again, I think the original question you're asking, how do you do that while the enterprise accepts it and their taste changes so that they understand what quality looks like now?

[13:08] And they understand, because you're touching on AI sovereignty by that statement too, but also understanding in a world where everyone's watching their costs, what value they're getting. Well, it's cost and effectiveness. Cost is a metaphor for two things. What did you pay and what did you lose?

[13:27] Okay, so the cost is not just what you paid for the token. It's what portion of your IP did you have to transfer to get the token?

[13:34] And so what we're saying is you can control the true cost. For example, almost all enterprises, including government, non-government, have parts of their enterprise, they'd be very happy. No one cares really what you're doing in your marketing in Argentina. So you could use a model that de facto is transferring what you're doing to someone else and it transfers to your competitor. They would care if you understand how you organize your supply chain or what parts of your supply chain or what vendors you understand to be great. Okay, that stuff has to stay enterprise. As a cost thing, it's what did you pay for, what did you lose? And also, then you get to value.

[14:16] In both cases, you need something like an application platform. Currently, the only one available at scale is ours, Ontology. That application will allow you to control actual cost, as defined by me, and control and understand actual value. And that value is going to come down to... What is the delta between what you could do with or without this? Correct. And we do both, and we do it in a way that is quite unique because you also need to be able to instruct and build product around it. That's the FDA. And you have to have to know how to work with the institution. But you've also said that CEOs, you know, we've talked about the price of tokens, and you've said that CEOs are livid because they're paying for tokens that create no value. No, no, they're livid because they're paying for tokens that create no value. And they're doubly paying because some portion

[15:04] of their IP has been migrated to their competitor. It gets back to the sovereignty point. It's like, you know, this is why, again, I don't want to be vulgar, but most CEOs I deal with com-

pare this to some kind of venereal disease. And they're really, really upset. And actually, in a weird way, they're less upset now because the sovereign platform shows them that they can actually enjoy the product without getting something that they don't want to have for the rest of their life. And without, and by the way, ensuring that the stuff that is integral to them and the stuff that is proprietary that they care about, they retain control. Yeah, they can retain control. And honestly, what we're seeing in the next version is you could even white label this if you want and use that as your IP to expand into other verticals. Right. But so but yes, what made people very, very look, the CEOs I deal with, not all of them are technical, they're all shrewd. And they're all intelligent. In fact, by and large, one of the ways you make it to the top is

[16:04] you hide how smart you are. So they do not like Yes, you're laughing because you're trying and failing at this. You're trying to hide us. But it's not working. In my case, it was true. Yes, exactly. Every single person who's like sure they're intelligent tells you how stupid they are. Just like every all your super wealthy clients are telling you how they can't really afford to pay you. Exactly. They're so wealthy. Their assets are like it's all a liquid now. They'll pay you as soon as it's liquid. It's hard being a multi billionaire. But the issue really becomes here, people want to have the sovereignty of the asset. There's also the other issue too. And that is, by the way, protecting themselves in terms of the incursions that are continuously coming after us from a security standpoint. So frankly, when you look at wealth business, integrity of the assets, security of the assets, well, that's going to be stakes. Yeah, well, I mean, with these new models, it's going to be more guerrilla war than I mean, like, we're all going to we're all

[17:04] in a helmet, how quickly can you mitigate and how quickly can you shoot back environment like the models are able to expose security flaws already at a scale that we're not really equipped to deal with. And that is going to be a societal issue for every single organization, government, non government. And the only unique thing we're doing there, which is pretty helpful is how can you patch the penetration vectors that were unknown quicker than they can be exploited? Correct. Because for us, you know, one thing getting through is incredibly dangerous from that standpoint. So yeah, 100% Yeah, well, 100% safety is the objective. Yeah. Well, I think I think I'm not talking about you guys, but societally, we're going to have to move to what did we do after? How do we can how can we identify the penetration vectors and fix them quicker than they can be penetrated and also different levels of places that have different levels of security?

[18:04] And an understanding that there is no 100% protection. These models are excruciatingly adept at finding attack vectors that a human would not be able to find. Exactly. That gets to the next question I want to get to with you. And that is on AI competition. Some people would say it's not about the models at all. You may disagree with that. It's about energy, semiconductor supply, data centers, compute infrastructure as destiny as you know what's going on, I think. $150 billion worth of AI data centers have been blocked in the US by various by various local groups. Do you think these are stepping stones? The why? How do you know? Well, first of all, it's it's not the model. It's what you do with the model. And that's hard for the companies to accept because they don't produce application letters, FTS ontology foundry FTS. So with that obvious caveat, I look, I think the

[19:04] primary risk to us in America is just political. Like the elephant in the room that somehow does not get addressed by anybody who understands these issues, which is a problem and only in a kind of hyperbolic way gets addressed by like the far left and to some extent, the far right is this these are wealth creation mechanisms, whoever wins or loses. I'm not speculating on IPO or value of IPO, but me being 20 times wealthier than I am now is a societal problem. And when you talk to people, especially people I agree with on other issues, the answer is always, but everybody else's wealth is going to go up by 4% a year.

[19:54] I just don't think it's explainable to the American people or any Western democracy in general. Why? And then you say, who's making the money? Now, Palantir, I have arguably one of the first or second largest fan bases in the world. I also have one of the first or second largest anti-fan bases in the world, but the fan base is probably 10 times larger than the anti-fan base. But it's- so I would say with that caveat, I'm one of the most popular CEOs in the world. And I wouldn't know how to explain that to my fans. And like pretending we can just defer this issue just plays into the extremists.

[20:36] Now, it's very hard to find a solution. The extremist view is let's blow up the U.S. economy with some kind of wealth tax that whether they realize it or not, and often you think- I do think they do realize it, would just shut off innovation, kill the startups. And at the end, actually, would probably be pretty okay for people like me because we pay it, but then the startups that would compete against us get crushed. Correct. And it doesn't really solve the issue from that standpoint. Well, but again, it's the issue for them is maybe the issue. You mean the issue of how do you disperse wealth? You're right. It doesn't actually solve the issue they're pretending to care about.

[21:21] But it does solve the political issue, which they do actually care about, which is hurting people who are impossibly wealthy. Right. And it also, you know, you see people, a little bit of a movement now towards public benefit corporations. None of that's going to work. Which is all an attempt. First of all, you'd have to agree on what public benefit is. For example, I have a huge amount of respect for Dario, and I talk to him a lot. And we have incredible conversations. And we wouldn't agree on what public benefit is. And we can have very talkless kind of what we agree on, what we don't agree on, and in my view, what we get along because he's high integrity along the vector of what he believes in.

[22:07] I think he would tell you I'm high integrity on the part. We just don't agree. So that's what is public benefit would be even, and I think we agree more probably than most people. So you have that problem. Second problem is it's actually not that, okay, you always have to disambiguate like what I was pushing on here a little as you were going to the substantive problem. We might agree, we agree on the substantive problem, but the political problem, the substantive problem are not the same. And are not solvable the same way. They're not solvable the same way. And then this is like, and because we don't acknowledge this in the West, we are always solving political problems as if they're substantive problems and substantive problems as if they're political problems.

[22:47] But I don't see in most cases that much of a correlation. Witness, you want to help poor people. Like the way you help poor people universally is you get them educated. Nothing else has worked. Maybe there's some magic wand that we've never... So getting one share of SpaceX for every child. Well, look, I'm not going to, okay, you know, like... These are hard things to deal with. I'm very supportive of all efforts. The point I'm saying is, Let's define the political problem of within a spectrum, we acknowledge critiques and we solve actual substantive problems that have a political valence that makes the politics so that the far extremes on both sides, which are, in my view, crazy.

[23:30] And I think in the view of anybody who wants to produce anything. Forget, like we can disagree on certain social issues, but everybody watching this has an idea of like, has this ever worked in the history of humanity?

[23:41] Let's just take that standard. Show me this working. Ever. And if you do not get the political valence somewhat correct, you are essentially transferring power. And the neutral example here would be, and again, I don't want to be political, but I've been yelling at various important Germans in private for a long time, that if you do not take migration seriously, Even

if you disagree with me, or my view for the last 10 years, that it's going to be a disaster, even if I'm wrong in every point, I am right about what's going to happen politically. And what's going to happen politically is you're just transferring power away from people who want to solve problems to people who want to create problems so that they, by virtue of creating them, have more power to destroy the society.

[24:32] That's essentially the difference between rational and pragmatic. It could work. And people who are doing things that could not work. Okay. All these issues are structurally similar in the sense that if you do not address the elephant in the room, whether you agree with it or not. So my friends in tech, by and large, don't agree with me on this. But you don't have to agree with me on this or agree with me on migration to understand the second derivative I'm right about. And whether I'm right about the first statement, we can argue about that. But the second derivative is turned out to be this way over the last 10, 15 years consistently witnessed what's going on in Europe and what could go on here.

[25:12] And so in this case, it is like we who actually want a solution that can work have to somehow sit down and come up with ideas about what are we going to do about our wealth. And that is not just, hey, okay, I'll just take a caricature. In the past, you could say I'm giving all my money away. That just doesn't work anymore. You could say it's a good thing. It doesn't work because the people who did it gave it to things that most Americans think are loony or destructive. And I don't want to mention any names here, but we all can think of that. So that might have been good, but it does not work anymore. And then that just powers something that I think will happen in this country, which is some kind of crazy wealth tax.

[25:52] By the way, everybody here understands once you tax me, everybody is going to be taxed at some point with a net worth of a million dollars. And by the way, what people have underestimated is that extends the surveillance state, something things people think I power but I'm actually anti-power because to understand someone's net worth down to that level of granularity, you would need a very powerful product to look at all of their assets in real time. And how do you value those assets? And at what point are they sold? I mean, this is your metier. It's much, much more difficult. Well, it's difficult or it's much more punishing because you can just say, well, we're going to impute at the highest level, right?

[26:31] So you could make it very difficult and it could work. I don't think people have the confidence to do that. And I don't want to be involved in that. I mean, our products probably could do that, but I think it is a deep intrusion. By the way, something no one wants to talk about, it will also proxy be an intrusion into the most personal aspects of your life. Let's say for the sake of argument someone watching this has a non-standard personal life or a very standard personal life, which means they're happily married but occasionally on the side they have something that they don't really want to disclose. Maybe their partner knows about it, so there's nothing really immoral or whatever, but they don't want to disclose it all. They don't want to disclose it to their kids. They don't want to disclose it to their colleagues. But if you do this kind of wealth tax, what about the transfer of income for your hotel? Does that count?

[27:16] Does the gift you bring count? Is the watch you gave the person or they gave you, does that count? Because it does. And it opens up- It opens up the Pandora's box to no civil liberties protection. And by the way, that Pandora box once opened will be very hard to close. And it goes along a vector that will be very politically popular with people who claim to care about these issues that don't. Left and far right, who are constantly talking about these issues but either actually do not have no understanding of them or in practice don't care. Because when it comes down to like monitoring where your wealth is flowing, in your case of course not your case, including to your mistress and your mistress on the side or your mister I don't give a fuck,

those things are included.

[27:59] And one of the primary dangers of this political movement is it's a political movement. And it will override the protections that we in America have in the context of the First and Fourth Amendment and in the Constitution, the primary attributes of the Constitution say in Germany. So let me ask you one last thing because I'm conscious of time and we've gone longer than we anticipated. Let me ask you a basic question that I know is on everyone's mind. The AI race between the U.S. and China, how far ahead are we and where does it ultimately go from your vantage point and does it matter?

[28:40] No, no, I mean it's like this is the most important question. The winning, we've kind of forgotten the obvious but like the people who won the tech battles won the world. And I'll just take a, if you look at Japanese Chinese history as a paradigmatic example, up till roughly 600 A.D. China was very far ahead of Japan on all vectors. In de facto Confucianism, including having a literate culture, architectural accomplishments like building monasteries at scale

[29:24] in a way where they wouldn't collapse. Including size and stability. This was all imported from China through Korea to Japan. Then Japan decided to, there was a lot of complexity here, but because of the samurai culture they had a culture of high integrity meaning low corruption. That was working, so embracement of industry and embracing math and science. Pretty close to what Deng Xiaoping did as soon as he was able to, as soon as he had the power, including while Mao was, so that was, okay. The typical way we read this history is at some point Japan made a lot of mistakes and did some things that no one supports, including in Japan.

[30:27] I think a more objective version was they became superior on military and then they didn't give a real, they didn't really, they colonized Taiwan. And you see the same thing in Germany. There's a very important, very far left history of Germany and the conclusion over hundreds of pages is, but Germany became so confident in his military prowess they were like, okay, we might be wrong, let's see who wins on the battlefield. And these are truisms. The country that wins this race will dominate how things happen very far downstream.

[31:27] I don't want to be helped, but I obviously for lots of reasons, including a lifetime spent there and my view that I am partially European, would like to help. But currently the battle space is us or China and us being ahead is elliptical because it's like six months and we are very different in what we do well, but like the Chinese ability to refactor their models to deal with less compute. And to undercut pricing and their distillation practices, like their ability to do these things and just general aptitude is not going to disappear. And then it raises a lot of questions about what happens with, not just America, but America and Europe, because Europe is going to have to currently, for reasons that I'm quite sad about, but it's like is going to buy one of those products.

[32:25] There is not really another alternative. It's either like, if you take the total stack, compute, meaning chips, ways of working with compute, so software, you take the software that works on the data on top of that or with it, you take, so this integration layer, then you have an application layer, then you have an ability to install it in a way where people do or do not keep their IP, then you have the sovereign version so they do keep their IP or they can selectively choose. And then you have the ingenuity to work with it. That's all currently in the West in America and or in China. And like, and then everybody who's not is actually some weird derivative. It doesn't really count. They can't compete.

[33:09] So it'll be neck to neck basically. Well, I mean, if we're lucky, we need to somehow eke out ahead. And that is, that's why these comp, these questions are so crucial that you ask because how do you solve them while not losing the competitive race?

[33:26] We don't, we don't, and by the way, I think a lot of the safety and other framing in America is doesn't work because it's never put in the, in the competitive frame, especially on the war battlefield, because like we have to win this in, in the military. We have to win it in the civilian context. At the very least, we should try to be ahead. And that is crazy difficult to pull off. We have some advantages. I would say our advantage is creativity. Their advantage is scale, but our advantage is not absolute. In our own terms, it's not like we're the only creative people here. Like if you see what they've done with their models, that's creative. And that's actually one of the things I've been most impressed by the Chinese reaction is that it, the caricature of them, again, I think if people look at China, it turns out I have a different, like I'm obviously on our side completely, but I have a 13, 14-year history of becoming a very high-level practitioner of one of the great treasures of Chinese culture, Chen Taichi, with a master who worked for the Grandmaster, and I'm very interested.

[34:32] The, the, the kind of caricature. of America and China is Americans are swashbuckling creative cowboys, execution is not maybe the best, but they invent things no one else could invent, and the caricature of China would be the highest IQ scale population in the world, but it's not creative. The interesting thing about the AI revolution is these caricatures are not actually playing out. Like the Chinese reaction to us is much more creative. We have a number of scale players, of which I would include Palantir, but there are others, and then, but at the margin, they still are probably the advantage and disadvantage thing, but it's, it's, it's just not the caricature, and then, and then it's just, it's like we are lurching forward, and it, it is pretty insane, partly because we're lurching forward, and then there's a time function, which is, you know, every day where this goes on, we're lurching 100 days ahead of everybody else besides China. So it's like, when you're-

[35:35] The time function in this country and China is different than in Europe. Alex, you've been generous with your time. We went over your limit, and I thank you very, very much. Thank you for your thoughtful questions. We miss everyone in Rome. Have a great time. Thank you, Alex. Thank you.
